                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTE: This is a 'working draft' sequence. It currently consists of 32 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Young,G.,

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The RPCI-11 human BAC library was made from the blood of one male donor, as described by Oscegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 5:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                         Data from AC079810 and AC073128 was used to finish this clone, AC009974. Polymorphisms have been identified between AC073128 AC009974. A single plasmid region exists beteen 38812-38903. unresolved tandem in the HERV SVA exists between 184390-185163. PCR suggests that approximately 1700 bps are missing.
                                                                                                                                                                                                                                                                                                                The clone sequenced to the left is RP11-1077K22; the clone sequenced to the right is RP11-647O5. Actual start of this clone is at base position 1 of RP11-459I19; actual end is at base position 206854 of RP11-459I19.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. 1 MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc

NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
as soon as it is available and the accession number will
be preserved.

                                                                                                        The sequences given in AAH43681-84 represents genomic fragments encoding the human AMP-activated protein kinase gamma 3 subunit (PRKAG3). Detecting the presence of the PRKAG3 DNA, or a variant, is useful in determining a risk estimate of a metabolic disease, such as diabetes or obesity, in a subject. The variation may occur in exons 3, 4 or 10. In exon 3 variation may be a substitution of a G for a C at nucleotide 320, resulting in the amino acid substitution P71A; in exon 4 variation may be a substitution of a T for a C at nucleotide 550; and in exon 10 variation may be a substitution of a T for a C at nucleotide 1037, resulting in the amino acid substitution R340W. There may also be nucleotide variation.
                                                                                                                                                                                                                      New variants of human AMP-activated protein kinase gamma3 subunit associated with a metabolic disease e.g. diabetes or obesity and a for determining a risk estimate of diseases in subject by detections.
                                                                                                                                                                                                                                                        WPI;
                                                                                          Sequence

The invention relates to a spatially-addressable set of single exon CC nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting CC from human breast and BT 474 cells. The method involves contacting CC the probes with a collection of detectably labelled nucleic acids could to each probe of the microarray. The probes are useful for CC verifying the expression of regions of genomic DNA predicted to cencode proteins. They are useful for gene discovery, and for CC determining predisposition and/or prognosing breast disease. Gene CC expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater CC diversity of probes for measuring gene expression, with far less bias CC than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. CC Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly considered the production int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1;

                                                                                                                                                                                                                                                                                                                                                     measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           Claim
                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form printed specification, but was obtained in electronic from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                       The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular systems. Congenital heart disease, hypertension, cardiac arrhythmias and congenital heart disease.

                                                                                                                                       probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    243
```

probes which are derived from genomic sequences expressed in bone marrow. They can be used to measure gene expression in samples, which may enable the improved diagnosis and treatme

analyzing

gene

'n

Example

SEQ

ID

ő

658pp +

Sequence Listing; marrow

English nucleic

in the human in bone marrow

of cancers

invention

provides a number of single exon

                                                                                                                                                                                                               The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                           Sequence 378 BP; 80 A; 128 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 25; SEQ ID

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to single exon nucleic acid probes The present sequence is one surbe. The probes are useful for producing a microarray for predicting, measuring and displaying expression in samples derived from human placenta. The probes are for antenatal diagnosis of human genetic disorders.

                                                                                  The present invention relates to novel single exon nucleic acid in the present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where i hybridises at high stringency to a nucleic acid expressed in the breast. The probes are useful for predicting, diagnosing, grading staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The disease include: breast cancer, disorders of development, inflammatory diof the breast, fibrocystic changes, proliferative breast disease mon-carcinoma tumours.
                                Note: The sequence data for this patent did not form specification, but was obtained in electronic format at ftp.wlpo.int/pub/published_pct_sequences.

```
CC sequences ABA08235-ABA09574 represent nucleic acids encoding them. The CC invention also relates to vectors and recombinant host cells comprising a CC nucleotide of the invention, methods of producing the novel polypeptides, cc or polypeptides against the polypeptides, methods of detecting the nucleotides CC or polypeptides in a sample, and methods of identifying compounds which CC bind to polypeptides of the invention. Although novel, many of the CC polypeptides of the invention have homology to known proteins, thereby CC glving an insight into their probable biological activities, and hence CC polypeptides activities, including cytokine, cell proliferation or cell therapeutic applications. The polypeptides of the invention may CC have various activities, including cytokine, cell proliferation or cell chaematopolesis regulatory activity; tissue growth factor activity; immunomodulatory activity; activin- or inhibin-related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be considered in oncogenesis, cancer cell proliferation or metastasis.

CC Depending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  bone disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder; cell culture; drug screening; gene therapy; antiinflammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic; cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; antificanti; virucide; antibacterial;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc conditions, e.g., by protein or gene therapy. Such conditions include cc cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell cd disorders), chronic inflammatory conditions (e.g., asthma or arthritis), cc disorders), chronic inflammatory conditions (e.g., asthma or arthritis), cc arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal cc vascular growth. Polypeptides involved with tissue regeneration and cc repair (or nucleic acids encoding them) may be used to promote wound cc healing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, cc bacterial and fungal infections in addition to immune disorders. Cc Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to promote cells danaged by illness, can be used to augment or replace cells danaged by illness, can anipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells danaged by illness, can anipulate stem cells in the diagnosis of the above conditions, and in drug covered in the diagnosis of the above conditions, and in drug covered in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents the full length cDNA encoding the human AMP-activated protein kinase gamma 3 subunit (PRKAG3). Detecting the presence of the PRKAG3 DNA, or a variant, is useful in determining a risk estimate of a metabolic disease, such as diabetes or obesity, in a subject. The variation may occur in exons 3,4 or 10. In exon 3 variation may be a substitution of a G for a C at nucleotide 320, resulting in the amino acid substitution PTA; in exon 4 variation may be a substitution of a T for a C at nucleotide 550; and in exon 10 variation may be a substitution of a T for a C at nucleotide 1337, resulting in the amino acid substitution RA40W. There may also be variations is based on the full length cDNA as given, rather than on position 1 of the open reading frame.

```
CC useful as therapeutic for treating carbohydrate metabolism disorders such CC as diabetes, obesity, and disorders associated with muscle metabolism CC such as myopathy and cardiovascular diseases, to modulate AMPK CC activity, and for restoring a normal AMPK function. PRKAG3 sequence CC and its functionally altered mutants are useful for the diagnostic CC evaluation, genetic testing and prognosis of a metabolic disorder, CC preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are CC useful for detecting a dysfunction of carbohydrate metabolism resulting CC from the expression of a functionally altered allele of PRKAG3.

CC Transgenic animal and host cell transformed with PRKAG3 or a heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for Screening compounds able to modulate AMPK activity. Nucleic acid CC screening compounds able to modulate AMPK activity. Nucleic acid CC encoding PRKAG3 is useful for detecting mutations in a PrKag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain cxx
                                                                                                                                                                                                                                                                       The present sequence is a cDNA encoding human adenosine monophosphat (AMP)-activated kinase (AMPK) gamma subunit muscle-specific isoform, PRKAG3. Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle PRKAG3 is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş
             The present sequence is a cDNA encoding human adenosine monophosphate (AMP)-activated kinase (AMPK) gamma subunit muscle-specific isoform, complete PRKAG3. Mutation in Prkag3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders such as diabetes, obesity, and disorders associated with muscle metabolism such as myopathy and cardiovascular diseases, to modulate AMPK activity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic
evaluation, genetic testing and prognosis of a metabolic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1570
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allel of PRKAG3. Transgenic animal and host cell transformed with PRKAG3 or a heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid encoding PRKAG3 is useful for detecting mutations in a PrkAg3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PRKAG3 and is useful in gene therapy.
                                                                                                                                                                                                                                        Sus scrofa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC (AMP) activated kinase (AMPK) gamma subunit muscle-specific isoform, CC PRKAG3. Prkag3 gene is located in the RN locus of chromosome 15.
CC Mutation in Prkag3 results in an altered regulation of carbohydrate CC metabolism, particularly in skeletal muscle. PRKAG3 is useful as CC diabetes, obesity, and disorders associated with muscle metabolism cC such as myopathy and cardiovascular diseases, to modulate AMPK CC activity, and for restoring a normal AMPK function. PRKAG3 sequence CC and its functionally altered mutants are useful for the diagnostic CC evaluation, genetic testing and prognosis of a metabolic disorder, CC preferably a carbohydrate metabolism disorder. Primers that can detect a genetic polymorphic marker linked to a sequence encoding PRKAG3 are CC useful for detecting a dysfunction of carbohydrate metabolism resulting CC from the expression of a functionally altered allele of PRKAG3. CC Transgenic animal and host cell transformed with PRKAG3 or a heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid cencoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or CC in a sequence encoding the first cystathione beta synthase (CBS) domain CC of PRKAG3 and is useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                           a genetic polymorphic marker linked to a sequence encoding PRKAG3, are useful for detecting a dysfunction of carbohydrate metabolism resulting from the expression of a functionally altered allele of PRKAG3. Transgenic animal and host cell transformed with PRKAG3 or a heterotrimeric AMPK consisting of PRKAG3 or its mutant, are useful for screening compounds able to modulate AMPK activity. Nucleic acid encoding PRKAG3 is useful for detecting mutations in a Prkag3 gene, or in a sequence encoding the first cystathione beta synthase (CBS) domain of PRKAG3 and is useful in gene therapy.
                                                                                                  1510
                                                                                                                                                                                                                                                                                                                                                                               such as myopathy and cardiovascular diseases, to modulate AMPK activity, and for restoring a normal AMPK function. PRKAG3 sequence and its functionally altered mutants are useful for the diagnostic evaluation, genetic testing and prognosis of a metabolic disorder, preferably a carbohydrate metabolism disorder. Primers that can determine the carbohydrate metabolism disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a cDNA encoding pig adenosine monophosphate (AMP) activated kinase (AMPK) gamma subunit muscle-specific isoform, complete prkAG3. PrkAg3 gene is located in the RN locus of chromosome 15. Mutation in PrkAg3 results in an altered regulation of carbohydrate metabolism, particularly in skeletal muscle. PRKAG3 is useful as therapeutic for treating carbohydrate metabolism disorders such as therapeutic, obesity, and disorders associated with muscle metabolism disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New variants of the gamma subunit of vertebrate adenosine monophosphate-activated kinase for diagnosis or treatment of associated with energy metabolism such as diabetes, obesity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (INRG )
